

Assignment -1 : Group 6 , Yash Jhunjhunwala, 18CH10070
Anshuman Agrawal, 18CH10071

Hot fluid : Gasoline :-

$$\dot{m}_{\text{gasoline}} = 8000 \text{ lb/hr}$$

$$\text{Final temp} = 130^{\circ}\text{F}, \text{ Initial temp} = 150^{\circ}\text{F}$$

$$\text{Specific heat} = 0.55 \text{ Btu/lb}^{\circ}\text{F}$$

Cold fluid : Kerosene :-

$$\dot{m}_{\text{kerosene}} = ?$$

$$\text{Final temp} = 100^{\circ}\text{F}, \text{ Initial temp} = 70^{\circ}\text{F}$$

$$\text{Specific heat} = 0.48 \text{ Btu/lb}^{\circ}\text{F}$$

$$\text{Heat duty} = Q = 8000 \times 0.55 \times (150 - 130) = 88000 \text{ Btu/hr}$$

$$\dot{m}_{\text{kerosene}} = \frac{88000}{(100 - 70) \times 0.48 / 100} = 6111 \text{ lb/hr}$$

$$\text{LMTD} = \frac{(150 - 70) - (130 - 100)}{\ln\left(\frac{150 - 70}{130 - 100}\right)} = \frac{50}{\ln\left(\frac{8}{3}\right)} = 51^{\circ}\text{F}$$

$\mu_{\text{gasoline}} < 1$ but $\mu_{\text{kerosene}} > 1$ at avg. temperature

\therefore To calculate correction temperatures, we need k_c and F_c .

From the plot of F_c v/s k_c given for different API,

$$k_c = 0.09 \quad \text{for this } k_c, F_c = 0.526.$$

$$T_c (\text{gasoline}) = 130 + 0.526 (150 - 130) = 140.52^{\circ}\text{F}$$

$$t_c (\text{kerosene}) = 70 + 0.526 (100 - 70) = 85.78^{\circ}\text{F}$$

Hot fluid (gasoline)

$$D_2 = 2.469/12 = 0.206 \text{ ft}$$

$$D_1 = 1.66/12 = 0.138 \text{ ft}$$

$$D_e = \frac{0.206^2 - 0.138^2}{4}$$

$$= 0.0170 \text{ ft}$$

$$\text{Mass velocity} = \frac{8000}{\frac{\pi}{4}(0.206^2 - 0.138^2)}$$

$$= 435444 \text{ lb/hr ft}^2$$

$$\text{at } 140.52^\circ\text{F}, \mu = 0.42 \text{ cp}$$

$$= 0.42 \times 2.42 = 1.016 \text{ lb/ft hr}$$

$$Re = \frac{0.17 \times 435444}{1.016}$$

$$= 72860$$

$$j_H = 180$$

$$k = 0.088 \text{ Btu/}^\circ\text{F ft hr}$$

$$\left(\frac{c\mu}{k}\right)^{1/3} = \left(\frac{0.55 \times 1.016}{0.088}\right)^{1/3}$$

$$= 1.852$$

$$h_o = j_H \cdot \frac{k}{D_e} \cdot \left(\frac{c\mu}{k}\right)^{1/3} \cdot \left(\frac{\mu}{\mu_w}\right)^{0.14}$$

$$= 180 \times \frac{0.088}{0.17} \times 1.852 \times 1^{0.14}$$

$$= 172.56 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 172.56 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 172.56 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 172.56 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 172.56 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 172.56 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

Cold fluid (kerosene)

$$D = 1.38/12 = 0.115 \text{ ft}$$

$$\text{Flow area} = \frac{\pi \times 0.115^2}{4}$$

$$= 0.0104 \text{ ft}^2$$

$$\text{Mass velocity} = \frac{6111}{0.0104}$$

$$= 587596 \text{ lb/hr ft}^2$$

$$\text{at } 85.78^\circ\text{F}, \mu = 1.6 \text{ cp}$$

$$= 1.6 \times 2.42 = 3.872$$

$$\text{lb/ft hr}$$

$$Re = \frac{0.115 \times 587596}{3.872}$$

$$= 17452$$

$$j_H = 64$$

$$k = 0.082 \text{ Btu/}^\circ\text{F ft hr}$$

$$\left(\frac{c\mu}{k}\right)^{1/3} = \left(\frac{0.48 \times 3.872}{0.082}\right)^{1/3}$$

$$= 2.830$$

$$h_i = j_H \cdot \frac{k}{D} \cdot \left(\frac{c\mu}{k}\right)^{1/3} \cdot \left(\frac{\mu}{\mu_w}\right)^{0.14}$$

$$= 64 \times \frac{0.082}{0.115} \times 2.83 \times 1^{0.14}$$

$$= 129.15 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$h_{i_o} = 129.15 \times \frac{1.38}{1.66}$$

$$= 107.36 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 107.36 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 107.36 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 107.36 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$= 107.36 \text{ Btu/hr ft}^2 \text{ }^\circ\text{F}$$

$$\text{Clean overall co-efficient } (U_c) = \frac{172.56 \times 107.36}{172.56 + 107.36} = 66.18 \text{ Btu/hr ft}^2 \text{ } ^\circ\text{F}$$

$$\text{Dirty overall co-efficient } (U_D) :-$$

$$\frac{1}{U_D} = \frac{1}{66.18} + 0.004 \text{ } \checkmark \text{ dirt factor}$$

$$\Rightarrow U_D = 52.33 \text{ Btu/hr ft}^2 \text{ } ^\circ\text{F}$$

$$\text{Area} = \frac{Q}{U_D \Delta t_{LMTD}} = \frac{88000}{52.33 \times 51} = 33 \text{ ft}^2$$

$$\text{Area per unit length} = 0.435 \text{ ft}^2$$

$$\text{Length needed} = \frac{33}{0.435} = 75.86 \text{ ft}$$

\therefore 2 hairpins will be required (20x4)

$$\text{Surface applied} = 20 \times 40 \times 0.435 = 34.8 \text{ ft}^2$$

$$U_D(\text{actual}) = \frac{88000}{34.8 \times 51} = 49.58 \text{ Btu/hr ft}^2 \text{ } ^\circ\text{F}$$

$$R_d = \frac{66.18 - 49.58}{66.18 \times 49.58} = 0.0051 \text{ (dirt factor)}$$

Pressure Drop calculations :-

Gasoline	Kerosene
$D_e' = D_2 - D_1$	$R_e' = 17452$
$= 0.206 - 0.138$	
$= 0.068 \text{ ft}$	$f = 0.0035 + \frac{0.264}{17452^{0.42}}$
$\Delta P' = \frac{0.068 \times 435444}{1.016}$	$= 0.0079$
$= 29144$	

$$f = 0.0035 + \frac{0.264}{Re^{0.42}}$$

$$= 0.0035 + \frac{0.264}{(29144)^{0.42}}$$

$$= 0.007$$

$$\text{specific gravity} = 0.71$$

$$\rho_{\text{gasoline}} = 0.71 \times 62.5$$

$$= 44.38 \text{ lb/ft}^3$$

$$\Delta F_{\text{gasoline}} = \frac{4fG^2L}{2g\rho^2D}$$

$$= \frac{4 \times 0.007 \times 435444^2 \times 80}{2 \times 4.18 \times 10^8 \times 44.38 \times 0.068}$$

$$= 3.8 \text{ ft}$$

$$\text{velocity} = \frac{435444}{44.375 \times 3600}$$

$$= 2.72 \text{ fps}$$

$$\Delta F_e = \frac{2 \times 2.72^2}{2 \times 32.2} = 0.23 \text{ ft}$$

$$\Delta P = \frac{(3.8 + 0.23) 44.38}{144}$$

$$= 1.24 \text{ psi}$$

$$\text{specific gravity} = 0.805$$

$$\rho_{\text{gasoline}} = 0.805 \times 62.5$$

$$= 50.31 \text{ lb/ft}^3$$

$$\Delta F_{\text{gasoline}} = \frac{4fG^2L}{2g\rho^2D}$$

$$= \frac{4 \times 0.0079 \times 587596^2 \times 80}{2 \times 4.18 \times 10^8 \times 50.31^2 \times 0.115}$$

$$= 3.6 \text{ ft}$$

$$\Delta P = \frac{3.6 \times 50.31}{144}$$

$$= 1.26 \text{ psi}$$

\therefore both pressure drops are lower than the allowable pressure drop, \therefore the design is suitable.

Final Result :-

We need 2 hairpins to make this process happen. Both hairpins need to be connected in series since the pressure drop across both is lower than the allowable pressure drop.

The dirt factor obtained came out to be 0.0051.
